

Safety, Security and Improved Fan experience for Stadiums and Venues

Safety and Security

- Help manage fans who have previously been banned from the venue due to violent or unsocial behaviour.
- Provide real time alerts to security personnel if a banned fan approaches a gate.
- Real time alert includes images of banned fan's stored image and captured image to allow the security to conduct a final 'human' check of the banned fan.
- Use Search feature to quickly find a banned fan across live CCTV cameras or Video Management System's stored video.

Improved Fan Entry experience

- Fans or Members who opt in may use their face to enter through special gates for a faster entry experience.
- These fans are recognised as they approach the speed gate and their account information is checked.
- If the account and ticket information is correct a quick entry occurs through turnstiles.
- To ensure protection of privacy, no images of fans are stored.
- Use facial recognition to allow Members access to reserved areas without the need for an access card.

Fast and Accurate Facial Recognition

- Fast, accurate and reliable face recognition technology.
- Imagus Facial Recognition recently ranked 1st in Australia for accuracy and performance in 'wild' scenarios (challenging video environment with face angles, movement, lighting levels and masks/beards etc).
- Standalone or integrate with Video Management and Access Control systems.
- Easy to deploy and operate with intuitive User Interfaces.
- Australian made and Australian supported.

VIX VIZION AND PRIVACY

Imagus software has been designed with privacy principles and guidelines in mind. Contact Vix Vizion to learn how Imagus software operates to ensure data is protected and managed securely.
